

What time of the year are deer most active?

Spring (Most)– Summer – Fall – Hard Winters

The probability that deer will become a nuisance in your yard depends on heavily wooded areas, the density of deer population in your specific area, and whether or not they “nibble” or “pummel”.

Everything is fair game if deer find a food source.

In spring deer are eating to put on weight lost during winter and eating new growth. Deer are also most active early in the morning and evenings.
